A considered roadmap.

A reference-led frontend, built around explicit trust.

01 Recorded baseline

The scripted adapter owns all product state.

The interface does not know how data is stored.

Sample data is visibly distinct from real activity.

02 Definition of done

A result is complete only when evidence exists.

Every sensitive change asks for explicit approval.

Strict types and deterministic checks stay green.

03 Next milestones

Core workspace and accessible navigation.

Confirmation rails, local artifacts and activity lanes.

A live adapter, supplied separately after review.

Generic demonstration content. No real work or accounts are represented.
